

## REPORT

My project is a simple e-commerce website.

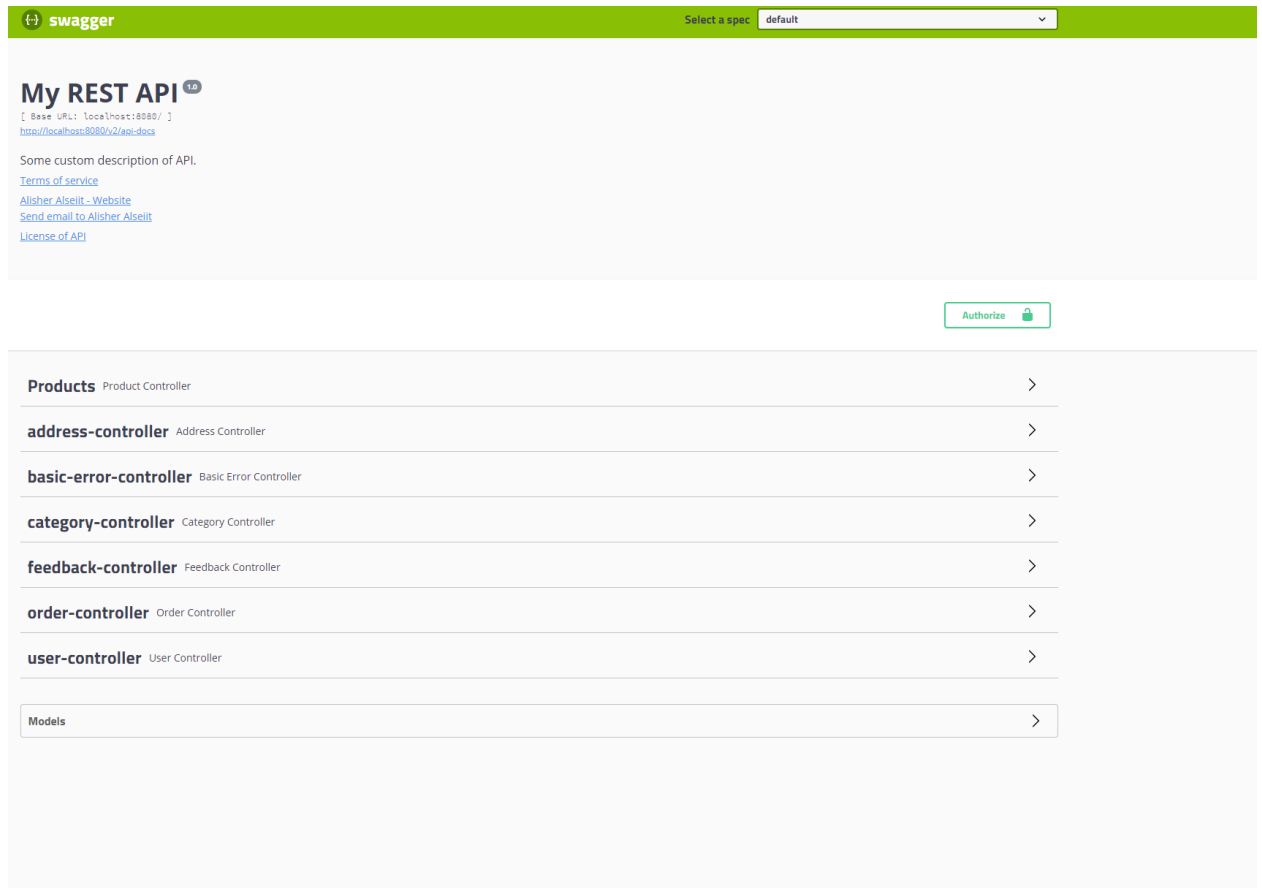

First of all, the user can sign up and login. There are three roles. Admin, User, Admin Trainee. Depending on the role, the user may or may not do some operations. These restrictions are made through jwt.

As you can see on the system architecture below I have 8 tables.

As an admin I can post any products, categories, and delete products, orders, users. Users can leave a feedback to the products, also make some orders.

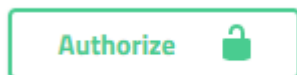

# I have used swaggerUI to create simple Client User Interface

as you can see, here we have all the controllers that the user can use

but if the user doesn't add the desired Bearer token here and logged in, he can't use these functionalities

To login, user should enter to this button.

After that enter here Bearer token.
